Fantastec Front-end Coding Assignment
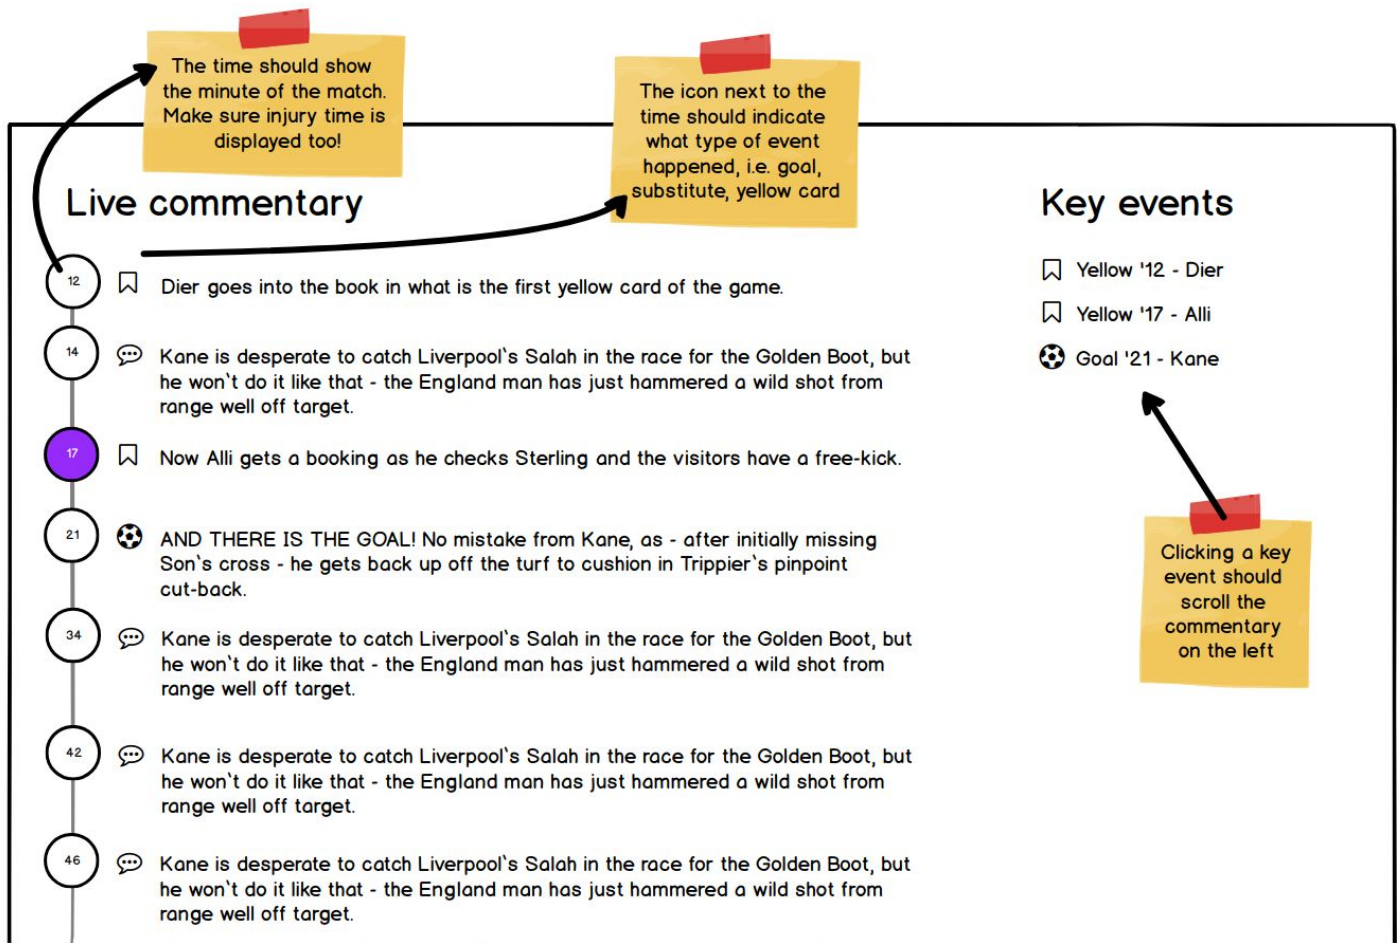

Consider the following UX wireframe for a simple match commentary interface:

Please build this interface using HTML, CSS and JavaScript. React is preferable, but you can use whatever framework you like.

Please publish your work to a git repository and send us a link / zip file. Please commit frequently so we can see how you work. Please provide documentation and/or comments and instructions on how to run it locally.

Feel free to design the interface as you see fit, but follow the basic layout shown in the wireframe. Feel free to get creative with typography, spacing and colour.

The idea is that the commentary is live, however for the purposes of this exercise, you can hard code the data using plain JavaScript objects without making API calls.

Please see annotated wireframe for specific behavioural notes.

Try not to spend more than a few hours on the exercise, we're interested in quality over quantity.
